

The Impact of Building Information Modeling on user's Behavior and It's reflection
on Building Performance in Construction Industry in Libya

By

AHMAD ALI M. AMER

Thesis Submitted in Fulfilment as the Requirement for Doctor of Philosophy (Built
Environment) by Research Degree in the Faculty of Architecture and Built
Environment

IUKL

2017

DECLARATION

I declare that the thesis is my original work except for quotations and citations which have been duly acknowledged. I also declare that it has not been previously, and is not concurrently, submitted for any other degree at Infrastructure University Kuala Lumpur or other institution.

Abstract of the thesis presented to the Senate of Infrastructure University Kuala Lumpur in fulfilment of the requirement for the degree of Doctor of Philosophy Built Environment

THE IMPACT OF BUILDING INFORMATION MODELING ADOPTION ON
USER'S BEHAVIOR AND ITS REFLECTION ON BUILDING PERFORMANCE
IN CONSTRUCTION INDUSTRY IN LIBYA

By

AHMAD ALI M. AMER
MAY 2017

Chair: Prof. Dr. Zulkifli Bin Hanafi

Faculty: Architecture and Built Environment

Every evolution in technology has been achieved with advances in computer science. The result of each evolution is to provide more information to attain objectives easily. The present study employed primary data approach using questionnaire to survey the current situation of BIM adoption. A hypothesized model of BIM adoption configured as the interaction of CSFs, BIM adoption and B P. There were four hypotheses tested as pathway of exogenous, mediating and endogenous variables. The discussion analyses the main relative merits of using BIM and attempts to forecast their future. (Quantitative methodology using descriptive approach was employed. Using simple random sampling. SEM technique using Analysis of Moment Variance (AMOS) succeeded in establishing and validating an empirical model of BIM adoption in the construction industry in Libya. 1st order CFA, CFA, hypothesised model, generated model and re-specified model analysis succeeded in validating the detailed measurements. AMOS using technique, the succeeded in testing the mediating effect of BIM adoption the relationship between CSFs and BP. Interaction effect analysis between predictors and the mediator succeeded in explaining BP as endogenous variable. Path Analysis of Re-Specified model confirmed a direct positive significant influence of CSFs on the BIM adoption and BP. As achievement of research objectives, the CSFs succeeded in explaining BIM adoption, and confirmed BIM adoption as mediating variables. The present study concludes that CSFs should be considered as the main concern to predict BIM adoption for future Improvement of

Building Performance. Through re-specified model analysis, the present study has a fundamental finding to the body of knowledge to configure an interaction of CSFs as predictors on the BIM adoption and Building Performance in the significant structural model.

Acknowledgment

It would not have been possible to write this doctoral thesis without the help and support of the kind people around me, to whom goes my deepest appreciation. First of all, I would like to sincerely thank my parents: Ali Mohamad Amer and Khadija Mohamad Amer, who paved the way for me to carry on studying to this stage. If it had not been for their contribution, I would not have been successful in my studies. I feel indebted to my great supervisor, Professor. Dr. Zulkifli Bin Hanafi, without whose support, guide and comments I could never have been successful in studying PhD. His invaluable pieces of advice were the source of light enlightening the vague pathway before me. Not only a knowledgeable supervisor, but also, he has always been a wonderful friend of mine.

My next appreciation goes to my family who were inspiring and understanding allowing me to concentrate on my studies and writing this thesis. Words cannot express my gratitude to my wife: Hiffa Nuri Alfortas, as she was a great company and support encouraging me to pursue my studies and my beloved children Nura Ahmad Ali Amer and Yahya Ahmad Ali Amer. Eventually, I would like to thank all the staff at Infrastructure University Kuala Lumpur (IUKL) who were kind enough to provide an academic environment for me, as well as other students.

APPROVAL

This thesis was submitted to the Senate of Infrastructure University Kuala Lumpur (IUKL) and has been accepted as fulfilment of the requirement for the degree of (Doctor of Philosophy in Built Environment). The members of the Thesis Examination Committee were as follows:

Prof. Dr. Faridah Ibrahim
Faculty of Arts, Communication and Education
Infrastructure University Lumpur (IUKL)
(Chairmen)

Dr. Golnoosh Mantegh
Faculty Architecture and Built Environment
Infrastructure University Kuala Lumpur (IUKL)
(Internal Examiner)

Assoc.Prof.Dr. Sr Syahrul Nizam Bin Kamaruzzaman
Faculty of Built Environment
University of Malaysia (UM)
(External Examiner)

Sr.Dr. Mohd Nasrun Bin Mohd Nawi
School of Technology Management & Logistics
University Utara Malaysia (UUM)
(External Examiner)

Assoc. Prof. Dr: Manal Mohsen Abood
Director
Centre for Postgraduate Studies
Infrastructure University Kuala Lumpur (IUKL)

CHAPTER 1

INTRODUCTION

1.1 Background of the Study

Building Performance (BP) associated with process of technology adoption is now becoming increasingly required and it has to be delivered and implemented in a sustainable manner (Gegana and Widjarnarso, 2015). Information Communication and Technology (ICT) has revolutionised the building design and the adoption of advanced modeling technologies in building design (Cao, et al., 2016). One of the latest technologies is Building Information Model (BIM). The present study identifies through a comprehensive literature review of the Critical Success Factors (CSFs) affecting BIM adoption (Zou, Kiviniemi and Jones, 2016; Nguyen, Shehab and Gao, 2010).

This study proposes an empirical model that examines these factors (Exogenous variables) "Senior Management Support (SMS), Training (T), User Trust(UT), User Experience(UE), Technical Support(TS), User Involvement(UI), Perceived Usefulness(PU), Perceived Ease of Use (PEU)" and Endogenous variables " Building Information Model (BIM), Building Performance (BP) that affecting the level of adoption and concerning the details involved in BIM for design construction in Libya. This proposed empirical model tested using Structural Equation Model (SEM). This model is expected to give guidelines for engineers, designers, developers and practitioners in the construction industry as well policy maker and stakeholder in the mentioned field (Newton and Chileshe, 2012).

Furthermore, with a rapid development of technological revolution, economic globalization and the fundamental change of social production method, human capital and social capital has become the key factor for a business organisation to the achievement of competitive advantage (Fang, et al., 2016). Management Information System (MIS) is charged with improving the performance of organisations and people through the employ of information technology. MIS is a multifaceted discipline, which
